COMP140 - Usability Analysis

1 Introduction

This report will analyse the COMP140 hardware hacking controller using the heuristic analysis method suggested by Nielsen [1].

2 Heuristics

The heuristics that were used were designed by Nielsen:

- Visibility of system status
- Match between system and the real world
- User control and freedom
- Consistency and standards
- Error prevention
- Recognition rather than recall
- Flexibility and efficiency of use

- Aesthetic and minimalist design
- Help users recognize, diagnose, and recover from errors
- Help and documentation [2]

However Nielsen's heuristics are not specific to games. Pinelle *et al* has designed heuristics that are game specific. The heuristics used here are relating to game controls such as clumsy input scheme and command sequences being too complex [3].

3 The Controller

Figure 1: The controller.

Figure 1 shows the controller, it is shaped like a throwing star to fit the theme of the

game it was designed for. It is designed for younger children that are more likely to be interested in different shaped controllers.

4 Two Improvements

The first issue with the controller is the aesthetic and minimalist design. The shape means that one side will be shaped similarly to a controller such as the PS4 controller, this side should be easy to grip and use. However the other side curves upwards and may be hard to grip. This may lead to the buttons on that side of the controller being harder to use. Also the change in shape may mean that the controller is uncomfortable to use for extended periods of use. A possible improvement could be to alter the shape of the controller to give it two hand grips.

Figure 2 shows a possible alternate design that has two hand grips making it easier to hold. The throwing star shape is also removable meaning it can be taken off if it is causing discomfort. This also allows for alternate shapes to be attached to the controller for use with other games.

Another issue is the visibility of system status, the controller should inform the user of the system status. Currently there is no indicator as to whether the controller is functioning correctly. The MakeyMakey kit has an LED to indicate whether it is powered on, the controller casing could be adapted to make this LED visible so the user. The MakeyMakey also has the functionality to add another LED that will flash when a button is pressed. An LED could be added to the controller to test whether the buttons are all functional. These two improvements will inform the user of the system status.

5 Conclusion

Nielsen says that it is difficult for an individual to find all the usability issues [1]. Therefore there are likely to be more issues with the controller that would be found if it was analysed by more people. However making the two improvements will improve the usability of the controller.
